What is claimed:

1.   A document encoded in an extensible machine-oriented structured notation, wherein the

2   document resides on one or more computer-readable media and comprises:

3   a node count representing a count of nodes in the document;

4   a node specification for each of the nodes, each of the node specifications comprising:

5   a node name;

6   a child list specifying index values of zero or more nodes which are children of the

7   node;

8   an attribute list specifying zero or more (attribute name, attribute value) pair

9   references for attributes of the node; and

10   a node value specification, which is empty if the node has no value; and

11   a data buffer containing attribute names and attribute values referenced from the attribute

12   lists and node values referenced from the node value specifications.

2.   The document according to Claim 1, wherein each (attribute name, attribute value) pair

     reference specifies a starting name position, a name length, a starting value position, and a value

3   length.

1   3.   The document according to Claim 2, wherein the starting name position and starting value

2   position are relative to a beginning of the data buffer.

1   4.   The document according to Claim 2, wherein the starting name position and starting value

2   position are relative to a beginning of the document.

1   5.   The document according to Claim 1, wherein the node value specification specifies a

2   starting value position and a value length.

1   6.   The document according to Claim 5, wherein the starting value position is relative to a

2   beginning of the data buffer.

1   7.   The document according to Claim 5, wherein the starting name position and starting value

2   position are relative to a beginning of the document.

8.   The document according to Claim 1, wherein each (attribute name, attribute value) pair

reference specifies a starting name position, an ending name position, a starting value position,

and an ending value position.

9.   The document according to Claim 1, wherein the node value specification specifies a

2   starting value position and an ending value position.

1   10.   A computer program product embodied on one or more computer-readable media, the

2   computer program product adapted for encoding a document in an extensible machine-oriented

3   structured notation and comprising:

4   computer-readable program code means for encoding a node count representing a count

5   of nodes in the document;

6   computer-readable program code means for encoding a node specification for each of the

7   nodes, further comprising:

8   computer-readable program code means for encoding a node name;

9   computer-readable program code means for encoding a child list specifying index

10   values of zero or more nodes which are children of the node;

11   computer-readable program code means for encoding an attribute list specifying

12   zero or more (attribute name, attribute value) pair references for attributes of the node; and

13   computer-readable program code means for encoding a node value specification,

14   which is empty if the node has no value;

15   computer-readable program code means for encoding a data buffer containing attribute

16   names and attribute values referenced from the attribute lists and node values referenced from the

17   node value specifications; and

18   computer-readable program code means for storing the encoded node count, the encoded

19   node specifications, and the encoded data buffer as the encoded document in memory or writing

20   the encoded document to one or more storage media.

1   11.   A computer program product embodied on one or more computer-readable media, the

2   computer program product adapted for processing a document encoded in an extensible machine-

3   oriented structured notation and comprising:

4   computer-readable program code means for parsing the document, further comprising:

5   computer-readable program code means for parsing a node count representing a

6   count of nodes in the document;

7   computer-readable program code means for parsing a node specification for each

8   of the nodes, further comprising:

9   computer-readable program code means for parsing a node name;

10   computer-readable program code means for parsing a child list specifying

11   index values of zero or more nodes which are children of the node;

12   computer-readable program code means for parsing an attribute list

13   specifying zero or more (attribute name, attribute value) pair references for attributes of the node;

14   and

15   computer-readable program code means for parsing a node value

16   specification, which is empty if the node has no value; and

17   computer-readable program code means for parsing a data buffer containing

18   attribute names and attribute values referenced from the attribute lists and node values referenced

19   from the node value specifications; and

20   computer-readable program code means for using the parsed document as input for the

21   processing.

1   12.   A computer program product embodied on one or more computer-readable media, the

2   computer program product adapted for converting an input document encoded in an extensible

3   human-friendly extensible markup language ("XML") to an output document encoded in a

4   machine-oriented extensible markup language ("mXML") and comprising:

5   computer-readable program code means for creating a document tree representation of the

6   input document;

7   computer-readable program code means for obtaining a node count representing a count

8   of nodes in the document tree representation;

9   computer-readable program code means for writing the node count to an mXML buffer;

10   computer-readable program code means for traversing each node in the document tree

11   representation and generating a corresponding node specification in the mXML buffer, further

12   comprising:

13   computer-readable program code means for generating a node name;

14   computer-readable program code means for generating an attribute list specifying

15   zero or more (attribute name, attribute value) pair references for attributes of the node;

16   computer-readable program code means for generating a child list specifying index

17   values of zero or more nodes which are children of the node; and

18   computer-readable program code means for generating a node value specification,

19   which is empty if the node has no value;

20   computer-readable program code means for generating a data buffer containing attribute

21   names and attribute values referenced from the attribute lists and node values referenced from the

22   node value specifications; and

23   computer-readable program code means for appending the data buffer to the mXML

24   buffer to form the output document.

1   13.   The computer program product according to Claim 12, wherein the computer-readable

2   program code means for generating each (attribute name, attribute value) pair reference further

3   comprises computer-readable program code means for generating a starting name position, a

4   name length, a starting value position, and a value length.

1   14.   The computer program product according to Claim 13, wherein the starting name position

2   and starting value position are relative to a beginning of the data buffer.

1   15.   The computer program product according to Claim 13, wherein the starting name position

2   and starting value position are relative to a beginning of the output document.

16.   The computer program product according to Claim 12, wherein the node value

specification specifies a starting value position and a value length.

17.   The computer program product according to Claim 15, wherein the starting value position

is relative to a beginning of the data buffer.

18.   The computer program product according to Claim 15, wherein the starting name position

2   and starting value position are relative to a beginning of the document.

1   19.   The computer program product according to Claim 12, wherein the computer-readable

2   program code means for generating each (attribute name, attribute value) pair reference further

3   comprises computer-readable program code means for generating a starting name position, an

4   ending name position, a starting value position, and an ending value position.

1   20.   The computer program product according to Claim 12, wherein the node value

2   specification specifies a starting value position and an ending value position.

1   21.   A system for encoding a document in an extensible machine-oriented structured notation,

2   comprising:

3   means for encoding a node count representing a count of nodes in the document;

4   means for encoding a node specification for each of the nodes, further comprising:

5   means for encoding a node name;

6   means for encoding a child list specifying index values of zero or more nodes

7   which are children of the node;

8   means for encoding an attribute list specifying zero or more (attribute name,

9   attribute value) pair references for attributes of the node; and

10   means for encoding a node value specification, which is empty if the node has no

11   value;

12   means for encoding a data buffer containing attribute names and attribute values

13   referenced from the attribute lists and node values referenced from the node value specifications;

14   and

15   means for storing the encoded node count, the encoded node specifications, and the

16   encoded data buffer as the encoded document in memory or writing the encoded document to one

17   or more storage media.

1   22.   A system for processing a document encoded in an extensible machine-oriented structured

2   notation, comprising:

3   means for parsing the document, further comprising:

4   means for parsing a node count representing a count of nodes in the document;

5   means for parsing a node specification for each of the nodes, further comprising:

6   means for parsing a node name;

7   means for parsing a child list specifying index values of zero or more nodes

8   which are children of the node;

9   means for parsing an attribute list specifying zero or more (attribute name,

10   attribute value) pair references for attributes of the node; and

11   means for parsing a node value specification, which is empty if the node

12   has no value; and

13   means for parsing a data buffer containing attribute names and attribute values

14   referenced from the attribute lists and node values referenced from the node value specifications;

15   and

16   means for using the parsed document as input for the processing.

1   23.   A system for converting an input document encoded in an extensible human-friendly

2   extensible markup language ("XML") to an output document encoded in a machine-oriented

3   extensible markup language ("mXML"), comprising:

4   means for creating a document tree representation of the input document;

5   means for obtaining a node count representing a count of nodes in the document tree

6   representation;

7   means for writing the node count to an mXML buffer;

8   means for traversing each node in the document tree representation and generating a

9   corresponding node specification in the mXML buffer, further comprising:

10   means for generating a node name;

11   means for generating an attribute list specifying zero or more (attribute name,

12   attribute value) pair references for attributes of the node;

13   means for generating a child list specifying index values of zero or more nodes

14   which are children of the node; and

15   means for generating a node value specification, which is empty if the node has no

16   value;

17   means for generating a data buffer containing attribute names and attribute values

18   referenced from the attribute lists and node values referenced from the node value specifications;

19   and

20   means for appending the data buffer to the mXML buffer to form the output document.

1   24.   The system according to Claim 23, wherein the means for generating each (attribute name,

2   attribute value) pair reference further comprises means for generating a starting name position, a

3   name length, a starting value position, and a value length.

1   25.   The system according to Claim 24, wherein the starting name position and starting value

2   position are relative to a beginning of the data buffer.

1   26.   The system according to Claim 24, wherein the starting name position and starting value

2   position are relative to a beginning of the output document.

1   27.   The system according to Claim 23, wherein the node value specification specifies a

2   starting value position and a value length.

1   28.   The system according to Claim 26, wherein the starting value position is relative to a

2   beginning of the data buffer.

29.   The system according to Claim 26, wherein the starting name position and starting value

position are relative to a beginning of the document.

30.   The system according to Claim 23, wherein the means for generating each (attribute name,

attribute value) pair reference further comprises means for generating a starting name position, an

ending name position, a starting value position, and an ending value position.

1   31.   The system according to Claim 23, wherein the node value specification specifies a

2   starting value position and an ending value position.

1   32.   A method for encoding a document in an extensible machine-oriented structured notation,

2   comprising the steps of:

RSW9-2000-0069-US1   -50-

3   encoding a node count representing a count of nodes in the document;

4   encoding a node specification for each of the nodes, further comprising the steps of:

5   encoding a node name;

6   encoding a child list specifying index values of zero or more nodes which are

7   children of the node;

8   encoding an attribute list specifying zero or more (attribute name, attribute value)

9   pair references for attributes of the node; and

10   encoding a node value specification, which is empty if the node has no value;

11   encoding a data buffer containing attribute names and attribute values referenced from the

12   attribute lists and node values referenced from the node value specifications; and

13   storing the encoded node count, the encoded node specifications, and the encoded data

14   buffer as the encoded document in memory or writing the encoded document to one or more

15   storage media.

33.   A method for processing a document encoded in an extensible machine-oriented

2   structured notation, comprising the steps of:

3   parsing the document, further comprising the steps of:

4   parsing a node count representing a count of nodes in the document;

5   parsing a node specification for each of the nodes, further comprising the steps of:

6   parsing a node name;

7   parsing a child list specifying index values of zero or more nodes which are

8   children of the node;

9   parsing an attribute list specifying zero or more (attribute name, attribute

10   value) pair references for attributes of the node; and

11   parsing a node value specification, which is empty if the node has no value;

12   and

13   parsing a data buffer containing attribute names and attribute values referenced

14   from the attribute lists and node values referenced from the node value specifications; and

15   using the parsed document as input for the processing.

1   34.   A method for converting an input document encoded in an extensible human-friendly

2   extensible markup language ("XML") to an output document encoded in a machine-oriented

3   extensible markup language ("mXML"), comprising the steps of:

4   creating a document tree representation of the input document;

5   obtaining a node count representing a count of nodes in the document tree representation;

6   writing the node count to an mXML buffer;

7   traversing each node in the document tree representation and generating a corresponding

8   node specification in the mXML buffer, further comprising the steps of:

9   generating a node name;

10   generating an attribute list specifying zero or more (attribute name, attribute value)

11   pair references for attributes of the node;

12   generating a child list specifying index values of zero or more nodes which are

13   children of the node; and

14   generating a node value specification, which is empty if the node has no value;

15   generating a data buffer containing attribute names and attribute values referenced from

16   the attribute lists and node values referenced from the node value specifications; and

17   appending the data buffer to the mXML buffer to form the output document.

1   35.   The method according to Claim 34, wherein the step of generating each (attribute name,

2   attribute value) pair reference further comprises the step of generating a starting name position, a

3   name length, a starting value position, and a value length.

1   36.   The method according to Claim 35, wherein the starting name position and starting value

2   position are relative to a beginning of the data buffer.

37.   The method according to Claim 35, wherein the starting name position and starting value

position are relative to a beginning of the output document.

38.   The method according to Claim 34, wherein the node value specification specifies a

starting value position and a value length.

1   39.   The method according to Claim 37, wherein the starting value position is relative to a

2   beginning of the data buffer.

1   40.   The method according to Claim 37, wherein the starting name position and starting value

2   position are relative to a beginning of the document.

1   41.   The method according to Claim 34, wherein the step of generating each (attribute name,

2   attribute value) pair reference further comprises the step of generating a starting name position, an

3   ending name position, a starting value position, and an ending value position.

1   42.   The method according to Claim 34, wherein the node value specification specifies a

2   starting value position and an ending value position.

1   43.   A document encoded in an extensible machine-oriented structured notation, wherein the

2   document resides on one or more computer-readable media and comprises:

        a node count representing a count of nodes in the document;

        a node specification for each of the nodes, each of the node specifications comprising:

                a node name;

                a child list specifying index values of zero or more nodes which are children of the

node; and

                a node value specification, which is empty if the node has no value; and

9   a data buffer containing node values referenced from the node value specifications.

1   44.   A method for encoding a document in an extensible machine-oriented structured notation,

2   comprising the steps of:

3   encoding a node count representing a count of nodes in the document;

4   encoding a node specification for each of the nodes, further comprising the steps of:

5   encoding a node name;

6   encoding a child list specifying index values of zero or more nodes which are

7   children of the node; and

8   encoding a node value specification, which is empty if the node has no value;

9   encoding a data buffer containing node values referenced from the node value

10   specifications; and

11   storing the encoded node count, the encoded node specifications, and the encoded data

12   buffer as the encoded document in memory or writing the encoded document to one or more

13   storage media.
